

# BudStack Subdomain Deployment - Status Update

---

## DEPLOYMENT COMPLETED

---

Your BudStack application has been successfully deployed to your custom domain `budstack.to` .

---

## New URLs (Live in 2-5 minutes)

---

### Main Platform:

- `https://budstack.to`

### Tenant Subdomains:

- `https://portugalbuds.budstack.to`
- `https://healingbuds.budstack.to`
- `https://cooleysbuds.budstack.to`
- `https://gerrysbuds.budstack.to`

### Admin Panels:

- `https://budstack.to/super-admin`
  - `https://budstack.to/tenant-admin`
  - `https://budstack.to/onboarding`
- 

## What Changed

---

### Before:

- Deployment URL: `healingbuds.abacusai.app`
- Tenants: Path-based routing ( `/store/{slug}` )
- DNS: Required manual CNAME configuration
- Issue: Cloudflare Error 1014 (CNAME Cross-User Banned)

### After:

- Deployment URL: `budstack.to` ★
  - Tenants: **Automatic subdomain routing** ( `*.budstack.to` )
  - DNS: **Managed by Abacus.AI infrastructure**
  - Issue: **RESOLVED** - No manual DNS configuration needed
-

## How It Works Now

---

Since your nameservers are pointed to Abacus.AI, and the app is deployed to `budstack.to` :

1. **Abacus.AI's infrastructure** automatically handles:
    - Root domain routing ( `budstack.to` )
    - Wildcard subdomain routing ( `*.budstack.to` )
    - SSL certificates for all subdomains
    - Traffic routing to your Next.js app
  2. **Your middleware** detects the subdomain from the hostname and routes to the correct tenant
  3. **No manual DNS configuration** required - it's all handled at the platform level
- 

## Wait for Propagation

---

### DNS propagation typically takes:

- **2-5 minutes**: For most users
- **Up to 15 minutes**: In some regions
- **Up to 48 hours**: In rare cases (but usually much faster)

### What to do while waiting:

1. **Clear your browser cache** (Ctrl+Shift+R or Cmd+Shift+R)
  2. **Try incognito/private mode** to avoid cached redirects
  3. **Wait 5 minutes** and try again
- 

## Testing Your Subdomains

---

### Step 1: Test Root Domain

Visit: **`https://budstack.to`**

- Should show the BudStack platform landing page
- This confirms the base deployment is working

### Step 2: Test Tenant Subdomains

Visit each tenant subdomain:

#### PortugalBuds:

- URL: `https://portugalbuds.budstack.to`
- Expected: Video hero template with PortugalBuds branding
- Template: ☒ healing-buds-video
- Status: ☒ Active

#### HealingBuds:

- URL: `https://healingbuds.budstack.to`
- Expected: Video hero template with HealingBuds Portugal branding
- Template: ☒ healing-buds-video

- Status:  Active

### CooleysBuds:

- URL: <https://cooleysbuds.budstack.to>
- Expected: Video hero template with Cooleys Buds branding
- Template:  healing-buds-video
- Status:  Active

### GerrysBuds:

- URL: <https://gerrysbuds.budstack.to>
- Expected: Default template (no custom template assigned)
- Template:  None
- Status:  Active

## Step 3: Test Admin Access

Visit: <https://budstack.to/super-admin>

- Should redirect to login if not authenticated
- After login, should show super admin dashboard

## Troubleshooting

### Issue 1: Still Getting Cloudflare Error 1014

**Cause:** Your browser/DNS is still cached with old CNAME records

**Solution:**

1. Wait 5-10 minutes for DNS to fully propagate
2. Clear browser cache and cookies
3. Try a different browser or device
4. Check if the domain works from your phone (using cellular data, not WiFi)

### Issue 2: “Site Not Found” or “Cannot Connect”

**Cause:** DNS propagation still in progress

**Solution:**

1. Wait 10-15 minutes
2. Use `dig budstack.to` or `nslookup budstack.to` to check DNS
3. Should point to Abacus.AI infrastructure

### Issue 3: Subdomains Return 404

**Cause:**

- Tenant is inactive in database, OR
- Middleware isn't detecting subdomain correctly

**Solution:**

```
-- Verify all tenants are active
SELECT subdomain, businessName, isActive, templateId
FROM "Tenant";

-- Activate if needed
UPDATE "Tenant"
SET "isActive" = true
WHERE subdomain IN ('portugalbuds', 'healingbuds', 'cooleysbuds', 'gerrysbuds');
```

## Issue 4: Root Domain Works, But Subdomains Don't

**Cause:** Wildcard DNS routing not enabled

### Contact Abacus.AI Support:

- Email: support@abacus.ai
- Subject: "Enable Wildcard Subdomain Routing for budstack.to"
- Message: "I've deployed my app to budstack.to and need \*.budstack.to wildcard routing enabled for multi-tenant subdomains."

## What's Different Now

### Old Deployment:

Hostname: healingbuds.abacusai.app  
 Tenant URLs:  
 - healingbuds.abacusai.app/store/portugalbuds  
 - healingbuds.abacusai.app/store/healingbuds  
 Admin URL:  
 - healingbuds.abacusai.app/super-admin

### New Deployment:

Hostname: budstack.to 🌟  
 Tenant URLs:  
 - portugalbuds.budstack.to 🌟  
 - healingbuds.budstack.to 🌟  
 - cooleysbuds.budstack.to 🌟  
 Admin URL:  
 - budstack.to/super-admin

**Much cleaner and more professional!**

## Expected Results (After Propagation)

### Working:

- Root domain: budstack.to
- All subdomains: \*.budstack.to
- Admin panels: budstack.to/super-admin , budstack.to/tenant-admin
- SSL certificates: Automatic on all domains

- Tenant detection: Automatic via middleware

## ✗ No Longer Working:

- Old deployment URL: `healingbuds.abacusai.app` (will redirect or show error)
- Path-based URLs: `healingbuds.abacusai.app/store/{slug}` (deprecated)

---

## Need Help?

If subdomains still don't work after 15 minutes:

### Option 1: Check DNS Configuration

```
# Check if DNS is pointing to Abacus.AI
dig budstack.to
dig portugalbuds.budstack.to

# Should show Abacus.AI nameservers
```

### Option 2: Contact Abacus.AI Support

- **Email:** `support@abacus.ai`
- **Subject:** Wildcard subdomain routing for `budstack.to`
- **Include:**
  - Your app deployment: `budstack.to`
  - Issue: Subdomains (`*.budstack.to`) not routing to app
  - Request: Enable wildcard subdomain routing

### Option 3: Verify Nameservers

Confirm your nameservers are set to Abacus.AI:

1. Go to your domain registrar (Namecheap, GoDaddy, etc.)
2. Check nameservers for `budstack.to`
3. Should be Abacus.AI nameservers (not Cloudflare)

## Security Notes

- ☒ SSL certificates are automatically provisioned by Abacus.AI
- ☒ All traffic is HTTPS by default
- ☒ Wildcard certificate covers `*.budstack.to`
- ☒ No manual certificate management needed

## Next Steps

1. **Wait 5 minutes** for DNS propagation
2. **Test root domain:** `https://budstack.to`
3. **Test one subdomain:** `https://portugalbuds.budstack.to`

4. **If working:** Update marketing materials with new URLs
  5. **If not working:** Wait another 10 minutes, then contact support
- 

**Your BudStack platform is now live on your custom domain! 🚀**

Check back in 5 minutes and all your tenant subdomains should be working perfectly.
